Standalone or multi-user network based digital asset management

Section map : **Outline** - [Summary](#) - [Details](#)

iBase Manager is a professional multi-user or standalone network based digital image database and media asset management system for cataloguing and indexing all manner of digital media, including images, sound and video files, PDFs etc...

Manager is used by heritage and culture organisations and businesses wishing to catalogue and manage their digital assets. It provides for not only the creation and management of a structured subject / category / keyword hierarchy, but also enables sets of data fields to be created that are specific to each of any number of separate item types within a single database.

Assets can be published to the web or an intranet if required, and there is a seamless and straightforward upgrade path from cataloguing to Trinity system for web or intranet access. For more details on this see the [Trinity Features](#) page.

More information about [standalone or multi-user cataloguing](#).
